Notes:

- The value of R_{th JA} is measured with the device mounted on 1in² FR-4 board with 2oz. Copper, in a still air environment with TA =25°C. The value in any given application depends on the user's specific board design.
- The power dissipation P_D is based on T_{J(MAX)}=150°C, using ≤ 10s junction-to-ambient thermal resistance.
- Repetitive rating, pulse width limited by junction temperature T_{J(MAX)}=150°C. Ratings are based on low frequency and duty cycles to keep initial T_J=25°C.
- The R_{th JA} is the sum of the thermal impedance from junction to lead R_{th JL} and lead to ambient.
- The static characteristics in Figures 1 to 6 are obtained using <300us pulses, duty cycle 0.5% max.
- These curves are based on the junction-to-ambient thermal impedance which is measured with the device mounted on 1in² FR-4 board with 2oz. Copper, assuming a maximum junction temperature of TJ(MAX)=150°C. The SOA curve provides a single pulse rating.
